

Family *ULTRASCAN*

Product **Partial Discharge Monitors**

Description **FJU (Field Junction Unit)**

Part Number **P2962.XXX.XXX (portable)**

P3142.XXX.XXX (fixed)

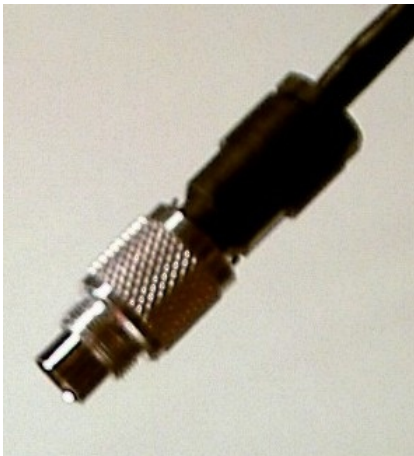

Field Junction Units (FJUs) are intelligent nodes which allow an ULTRASCAN monitoring network to be established. Each FJU can accept up to two ultrasonic probes, and are linked to other FJUs or the CCU (Central Control Unit) with Bus Connecting Cables (J2964 series).

The FJUs can be connected in any order since they are uniquely addressed and the CCU searches the bus during initialisation to identify the structure of the network.

FJUs have magnetic fixings so they can be easily positioned anywhere on switchgear without having to drill or supply special fixing brackets.

They are supplied as either fixed or portable units the only difference being the connector philosophy.

Fixed units have screw connectors (see photo) whereas portable units have push/pull rapid deployment connectors.
